housing candie saint bernard paris
assistant architect

project: the renewal of the "ilot rue candie - passage saint bernard" is part of the rehabilitation of the popular bastille-district. the area is characterised by high density building interrupted by numerous hidden gardens and passageways. the concept of the project is movement: a huge wave flows over the "quartier", creating and connecting a housing project, a semi-interred gymnasium, outdoor sports facilities and commercial surfaces. despite its uncommon appearance, the project blends perfectly with its surroundings through the extensive use of zinc, the most common material for roofing in paris.

responsibility: member of the international design team, locally in charge of preparation of construction drawings and details, site supervision and general project management.
